01 Workflow

Stages and what they count as

The stages a task moves through, in order: what each counts as (pending, on hold or completed), the part it plays, who works in it and the usual moves. Admins change it; every number follows.

Every data point

DATA POINT	WHAT IT SHOWS AND HOW TO USE IT
How work flows	A task moves left to right through the Kanban stages to LIVE. Each lane is a department: the PM or team lead plans it (To do), Development builds it (In progress, Pushed to Master, Merged to Development, Pending for QA), QA tests it (QA Backlog, In QA, Done, or Issue Raised to send it back) and Release puts it live. Solid arrows are the usual moves, red dashed ones QA sending work back. The band underneath shows what each stage counts as. Click a stage for details.
One stage	What the stage means, who acts there, where it moves on to, the board column names that mean it, and which numbers on the dashboard it feeds.
Who does what	Each department and the stages where the next step is theirs.
Edit the workflow (admins)	Admins change the stages: order, names, departments, what each counts as, its roles, column names and arrows, and the rework rule. Once saved, every number on every page counts with it. Every version is kept and can be restored.
